

## WaterWarmth

# Accelerating the transition towards sustainable heating and cooling based on collective surface water heat pump systems

Total budget € 7.997.253  
ERDF € 4.798.352

Project period  
June 2023 – September 2026

## A GREEN TRANSITION

- WaterWarmth works on facilitating energy communities that are delivering the energy transition.
- Within the project we co-develop inspiring and replicable examples of cooperative aquathermal energy solutions, integrated into the local context, with citizens from across the North sea region.
- Aquathermal energy (AE) uses thermal energy from water to provide sustainable H/C for buildings. Surface waters act as a huge solar collector and store heat in quantities that exceed by far the energy requirements for H/C.
- The project empowers energy communities to accelerate the clearly needed energy transition.
